

Medical Research Council (MRC) Scale for Muscle Strength

The Medical Research Council (MRC) Scale for Muscle Strength is a commonly used scale for assessing muscle strength from Grade 5 (normal) to Grade 0 (no visible contraction). It was originally described by the [Medical Research Council in 1943](#)  The MRC sum score was first described by Kleyweg et al (1988) for use in the Dutch Guillain-Barré trial. This score was defined as the sum of MRC scores from six muscles in the upper and lower limbs on both sides so that the score ranged from 60 (normal) to 0 (quadriplegic).

The *Criteria* requires that each of the six muscle groups listed in the table are examined bilaterally, each with a score from 0 to 5 according to the scale in the right hand column.

MRC Sum score

Muscle		Score 0 - 5	MRC scale for muscle strength (0-5)
Shoulder abductors	Left	<input type="text"/>	Grade 5: Normal
	Right		
Elbow flexors	Left	<input type="text"/>	Grade 4: Movement against gravity and resistance
	Right		Grade 3: Movement against gravity over (almost) the full range
Wrist extensors	Left	<input type="text"/>	Grade 2: Movement of the limb but not against gravity
	Right		Grade 1: Visible contraction without movement of the limb (not existent for hip flexion)
Hip flexors	Left	<input type="text"/>	Grade 0: No visible contraction
	Right		
Knee extensors	Left	<input type="text"/>	MRC grade for each muscle given in full numbers: (4+/4.5 =4) (4- =3) (5- = 4)
	Right		
Foot dorsiflexors	Left	<input type="text"/>	
	Right		
Total (out of 60)
